

The cave is a rare creation of Nature. Apart from its labyrinth of corridors, its mysterious galleries and its strange stalactite formations, the "Cave of the Lakes" has something exclusively unique that does not exist in other well known caves. Inside the cave there is a string of cascading lakes forming three different levels that establish its uniqueness in the world.

The cave is an old subterranean river whose explored length is 1980 meters. In winter when the snow melts, the cave is transformed into a subterranean river with natural waterfalls. In the summer months, part of the cave dries up revealing a lace-work of stone-basins and dams of up to 4 m. in height. The rest of the cave retains water permanently throughout the year in 13 picturesque lakes.

The developed part of the cave is currently 500 meters long. The passage from lake to lake is possible by small man-made bridges. At the cave’s lower floor, human and animal fossils were found, among which that of a hippopotamus.

It is located near to the village of Kastria OF Leukasio Municipality  on the main road of Patras –Kalavryta – Kleitoria – Tripoli. It lies about 17 km from the town of Kalavryta, 9 km from Kleitoria and 60 km from Tripoli (tunnel Artemision).
